Ray Lucchesi Will Be Teaching How To Pump Up Array Performance At Storage Decisions in Las Vegas

Broomfield, Colo. – Friday, Nov. 17, 2006 – Most IT shops struggle implementing and backing up ever-increasing amounts of data storage. Although the need for more storage seems insatiable it is often unnecessary. Often poor storage performance is the key indicator IT shops use to determine when to purchase more storage. Storage performance tuning can and should be an ongoing activity and if done properly can lead to more controlled storage growth. Ray Lucchesi with Silverton Consulting (<http://www.silvertonconsulting.com>) will show how to improve storage array performance at Storage Decisions Conference on Dec. 6th.

The secrets to better performing data storage involve knowing your I/O workload and configuring storage to handle it well. Ray reveals how to buy fast storage at the best price, configure storage for the best performance, monitor your I/O workload, and improve storage performance over time. Ray provides some hints on how to manage your data to improve database and email performance and will also discuss best practices to configuring your SAN and host connections. Ray will also be there to answer any questions on other storage performance problems encountered in the data center.

ABOUT Silverton Consulting, Inc. - Silverton Consulting is a Strategy, Storage & Systems services company based in Colorado offering storage analyst, marketing, and product development services for storage vendors and offering storage product evaluation, performance tuning, data backup and recovery, storage design, consolidation, and disaster recovery services for storage end users.
