Storage is easy to tune for performance if you know how

Broomfield, Colo. – Most data centers struggle today installing and backing up ever-increasing amounts of data storage. Although the need for more storage seems insatiable current storage is often woefully under utilized. The problem is that poor storage performance is a key indicator used to determine when more storage is needed. Storage performance tuning can and should be an ongoing activity and if done properly can lead to more controlled storage growth. Ray Lucchesi, President of Silverton Consulting (<http://www.silvertonconsulting.com>) will be teaching “Storage Performance 101” at Storage Networking World October 15th to show how easily one can improve storage array performance.

The secrets to better performing storage involve knowing the I/O workload and configuring storage to handle it effectively. Ray reveals how to buy performing storage at the best price, configure storage for the best performance, monitor I/O workloads for performance anomalies, and tune storage performance over time. Ray provides some hints on how to improve database and email performance as well and will also discuss best practices to configuring your SAN and host connections. Ray will also be there to answer any other questions on storage performance.

ABOUT Silverton Consulting, Inc. - Silverton Consulting is a Strategy, Storage & Systems services company based in Colorado offering storage analyst, marketing, and product development services for storage vendors and offering storage product evaluation, performance tuning, data backup and recovery, storage design, consolidation, and disaster recovery services for storage end users.
